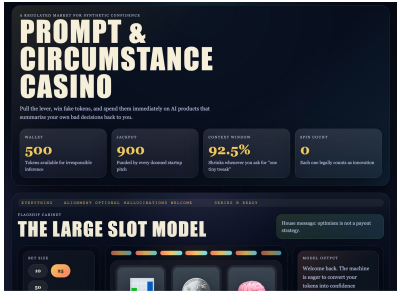
AI Slot Machine Experiment

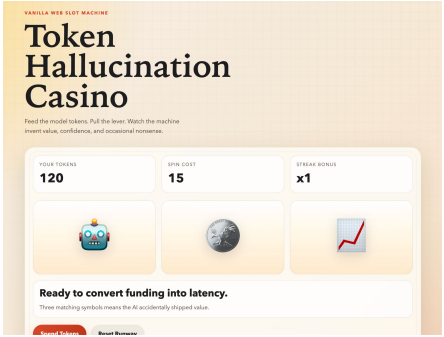
By The Best Team (1)

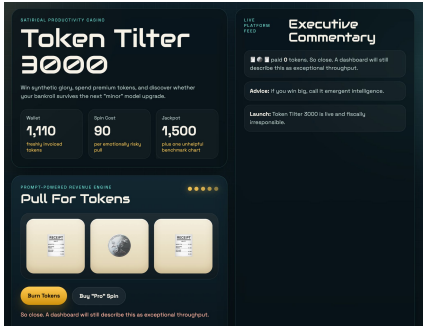
The Candidates (Refinement 1)

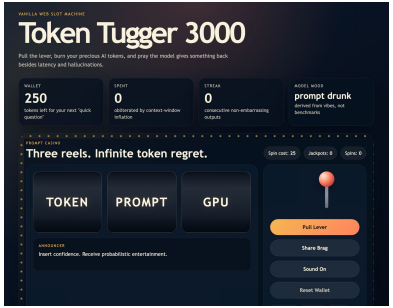
- Candidates 20, 10, 14, 17, 26 were our top 5.
- 26 had a different UI look compared to the rest with lighter colors
- 17 had a lot more features
- 14 had a live commentary feed
- 10 had a lever and generally nice animation with sound
- 20 made fun of AI the best
- Avg Tokens Used:

  29,000







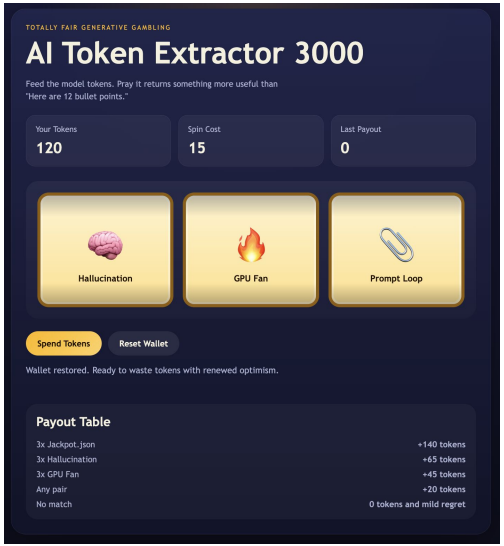


Refinement 2: The Prompt & Result

We gave the context of the first prompt and specified features that we liked from existing slot machines. What we asked to add was comments to the code and spinning animation for the slot rolls.

This is the previous prompt as context: *"Create a slot machine app that uses vanilla web technology like HTML, CSS, JavaScript, and platform APIs. The slot machine should make fun of AI, as if you are winning tokens and spending tokens." Just add comments to the code, and the spinning animation rolls.*

- *Spinning animation wasn't added consistently across all files*
- *Some existing features were lost during refinement*
- *Comments were only added to new code, not the whole file*
- *Prompt needed clearer instructions (full documentation + preserve features)*
- Canidates 14, 20, 17
- Avg Token Used: 21k tokens

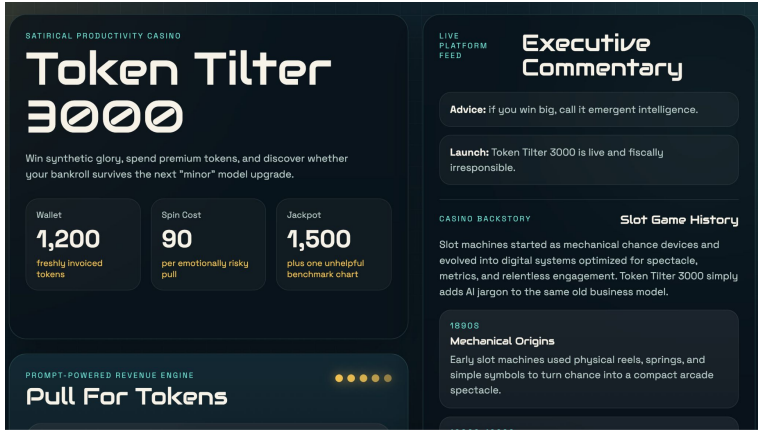


Refinement 3: The Prompt & Result

We gave the context of the first prompt again and corrected our mistake of asking for comments. We instead asked to include file headers and documentation, and not to remove existing functionality. In addition, to add back the game history and for everything to be consistent throughout all files. We hope it improves in functionality and documentation.

“This is the previous prompt as context: "Create a slot machine app that uses vanilla web technology like HTML, CSS, JavaScript, and platform APIs. The slot machine should make fun of AI, as in you are winning tokens and spending tokens." Include file headers that describe the file's purpose and include documentation in each file. Don't remove existing functionality, just add onto based on our requests. Add a section with slot game history onto the UI. Make sure everything is consistent throughout all files.”

- *A few of the files gave us the history of slot games rather than game result history*
- *Now includes header information for each file and comments are scattered throughout the top of functions*
- *Did not add JS docs*
- Canidates 14, 20
- Avg Token Used: 5k tokens



Refinement 4: The Prompt & The Result

We continue to give it the original prompt so it knows the context of the project. We want it to include code documentations for the functions rather then it being sparse and only the headers. In addition, sound effects and proper live game activity feed. Lastly, we have “code like a senior engineer” because it is a common phrase used when prompting in hopes it improves our code.

“This is the previous prompt as context: "Create a slot machine app that uses vanilla web technology like HTML, CSS, JavaScript, and platform APIs. The slot machine should make fun of AI, as in you are winning tokens and spending tokens." Make sure you include code documentation in each file with JSDocs commenting for each JS function. Make sure you include functionality for sound effects. Remove the section about game history and add a live game activity feed. Code like a senior engineer.”

- *Candidate 20 now has sound, comments for every function, and accurate live activity feed and looks good*
- *Candidate 14 now has sound, comments for every function, and brought back the live activity feed it originally had*
- *Maybe because we asked it to be a senior swe*
- no option to restart or have a way to get more tokens once they are out. (14)
- Canidate 20
- Avg Token Used: 13,954 tokens

Final Refinement (5): The Prompt & Result

“This is the previous prompt as context: "Create a slot machine app that uses vanilla web technology like HTML, CSS, JavaScript, and platform APIs. The slot machine should make fun of AI, as in you are winning tokens and spending tokens." Add a visual slot machine pulling lever
instead of the button with text. Redo the entire UI color theme to red, gold, and black.
Think like a product manager and code like a senior engineer. Ensure you maintain current functionality. Make no mistakes.”

- *Accurate results*
- *Functioning lever*
- *Accurate code feed*
- Color scheme is correct
- Everything looks good and is what we wanted
- Canidate 20
- Avg Token Used: 6,527 tokens

Observations

- Codex app vs cli yields different times (cli being shorter) and token usage
- Ai is not correct 100% of the time; it follows your prompts very literally (history added instead of result of the spin)
- When you prompt as a “senior swe” it is programms better and smoother
- At the end it did everything that we wanted (after all the refinement rounds)
